EXPERIMENT 11

Designing Pages and Navigation for a Multi-Page Business Application in Zoho Creator

Subject: No-Code Application Development

Aim

To design an understandable multi-page user interface for a leave management application in Zoho Creator.

Objectives

- Plan page hierarchy based on user tasks.
- Create navigation to forms, reports and summary pages.
- Evaluate usability and permissions across roles.

Selected Application

A Leave Management app containing Home, Submit Request, My Requests, Manager Review and HR Summary pages or views.

Requirements / Tools

- Existing or sample Zoho Creator application with leave form
- Page builder and application navigation settings
- Employee, manager and HR user scenarios

No-Code Connection

A multi-page no-code application needs more than screens: navigation must correspond to the user journey, permissions and the underlying forms and reports.

Illustrative Business Scenario

Design employee, manager and admin views for a Leave Management app and validate that each role sees relevant actions.

Experimental Procedure

Follow these steps in the designated simulator, browser or visual app builder. Menu locations and available features may vary by product version and account plan.

1. List core user tasks and separate employee, manager and HR functions.
2. Create a Home page with a heading, brief instructions and appropriate navigation links.
3. Add a Submit Request navigation item opening the leave application form.
4. Add My Requests and Manager Review links to filtered reports as applicable.
5. Create an HR Summary page linking to key counts and department-wise status reports.
6. Preview navigation on a desktop and mobile-sized screen; verify accessibility by user role.

No-Code Application Perspective

- Identify the user action and the visual interface element involved (form, page, workflow or report).
- Trace the data movement from input to processing to stored record, report or notification.
- Identify configuration that replaces traditional hand-written code and note where scripting might still be required.
- Check whether the experiment can be repeated using sample records and documented settings.

Evidence to Collect

- Screenshot of the configured screen, topology, tool or application.
- A short observation table showing input, action and output.
- One successful test and one failed or exceptional test with expected behavior.

Proposed navigation structure

Page/view	Primary audience	Purpose
Home	All users	Entry point and shortcuts
Submit Request	Employees	Enter leave information
My Requests	Employees	Track own request status
Manager Review	Managers	Review assigned applications
HR Summary	HR team	View cross-team statistics

Navigation tests

Test	Expected outcome
Home to form	Correct form opens
Form to report	New submission is visible to allowed user
Manager-only view	Unauthorized users cannot access
Mobile preview	Menu and labels remain readable

Interpretation / Analysis

- Navigation should match business tasks and keep frequently used actions easy to find.
- Hiding a link is not a substitute for configuring report and record-level permissions.
- Consistent naming and layout reduce training effort.

Evaluation Against a No-Code Solution

- Ease of creation: determine how much is configured visually rather than programmed.
- Data and integration: identify where records, connections or services are created and managed.
- Governance: consider role permissions, traceability and safe data handling.
- Limitations: identify any feature that may require paid access, external services or custom logic.

Verification / Test Cases

Suggested Test Record

Test	Input / action	Expected observation
Normal test	Valid sample values and supported action	Expected successful output
Boundary test	Missing value, invalid input or empty data	Validation or clear empty state
Access test	Unapproved user attempts restricted action	Access limited according to role
Repeatability	Re-run same valid example	Consistent output or explain differences

Observation Notes

During the practical session, replace the illustrative outcomes with actual observed results. Include the software/platform name, version if known, screenshots, and any errors encountered.

Results

A five-view information architecture and usability checklist were developed. Implementation screenshots and access-test outcomes should be added after platform testing.

Conclusion

Effective page design combines clear navigation, consistent terminology and appropriate permissions for each role.

No-Code Learning Outcome

This experiment links the technical concept to a practical no-code application development workflow. It highlights visual configuration, user experience, data handling and safe validation rather than treating the exercise as conventional full-code software development.

Precautions

- Use only fictional sample records for classroom demonstrations; avoid exposing passwords, tokens, employee information or real contact details.
- Record your own screenshots, observed outputs and deviations after executing the experiment. The examples below are models, not verified live results.
- Check access rights before sharing or publishing an app, report, workflow or externally reachable service.
