EXPERIMENT 8

Case Study on the Business Impact of a No-Code Application Implementation

Subject: No-Code Application Development

Aim

To assess how introducing a no-code workflow application can affect efficiency, accuracy and managerial visibility in a business process.

Objectives

- Identify inefficiencies in a manual business workflow.
- Propose a no-code solution and relevant success measures.
- Evaluate expected benefits, implementation risks and limits.

Selected Business Scenario

A hypothetical small organization managing employee leave requests by email and spreadsheets. The proposed intervention is a no-code leave management application with forms, approval routing and reports.

Requirements / Tools

- Defined user roles: employee, reporting manager and HR administrator
- A leave request form, status field and approval process
- Measures such as processing time, error rate and request visibility

No-Code Connection

No-code adoption should be evaluated as a business process improvement, not just a faster way to create screens. Metrics include cycle time, rework, auditability, training needs and total cost.

Illustrative Business Scenario

Use an employee leave-approval workflow as the illustrative case; treat its benefits as hypotheses until a real deployment supplies measured evidence.

Experimental Procedure

Follow these steps in the designated simulator, browser or visual app builder. Menu locations and available features may vary by product version and account plan.

1. Map the existing process: employee emails manager, manager approves, HR updates the spreadsheet.
2. Identify problems: duplicate entries, delayed decisions, uncertain status and inconsistent records.
3. Design an online request form with leave dates, leave type and reason.
4. Set up routing to the responsible manager and notify the employee of decisions.
5. Provide HR with a dashboard summarizing pending, approved and rejected applications.
6. Plan a pilot, train users, collect baseline measurements and evaluate changes after rollout.

No-Code Application Perspective

- Identify the user action and the visual interface element involved (form, page, workflow or report).
- Trace the data movement from input to processing to stored record, report or notification.
- Identify configuration that replaces traditional hand-written code and note where scripting might still be required.
- Check whether the experiment can be repeated using sample records and documented settings.

Evidence to Collect

- Screenshot of the configured screen, topology, tool or application.
- A short observation table showing input, action and output.
- One successful test and one failed or exceptional test with expected behavior.

Before and proposed after

Dimension	Manual workflow	No-code workflow
Submission	Email or paper	Standardized online form
Tracking	Separate messages/files	Central status record
Approval	Ad hoc messages	Defined approval action
Reporting	Manual consolidation	Automatically filtered report

Illustrative metrics (not observed results)

Metric	Baseline	Pilot target
Typical decision time	2 working days	1 working day
Missing/incorrect entries	10 per 100 forms	3 per 100 forms
Status inquiries	20 per month	8 per month

Interpretation / Analysis

- Targets are hypothetical planning figures and must not be represented as measured improvements.
- Expected benefits include fewer manual handoffs, auditability and faster reporting.
- Risks include inadequate access controls, training needs, workflow exceptions and subscription costs.
- Success can be evaluated using actual before/after measurements over comparable time periods.

Evaluation Against a No-Code Solution

- Ease of creation: determine how much is configured visually rather than programmed.
- Data and integration: identify where records, connections or services are created and managed.
- Governance: consider role permissions, traceability and safe data handling.
- Limitations: identify any feature that may require paid access, external services or custom logic.

Verification / Test Cases

Suggested Test Record

Test	Input / action	Expected observation
Normal test	Valid sample values and supported action	Expected successful output
Boundary test	Missing value, invalid input or empty data	Validation or clear empty state
Access test	Unapproved user attempts restricted action	Access limited according to role
Repeatability	Re-run same valid example	Consistent output or explain differences

Observation Notes

During the practical session, replace the illustrative outcomes with actual observed results. Include the software/platform name, version if known, screenshots, and any errors encountered.

Results

The case study identifies plausible benefits and a measurement plan for validating business impact. No real organization or completed deployment is claimed.

Conclusion

A well-designed no-code application can streamline a routine approval process, but sustainable value depends on adoption, security, process quality and measured performance.

No-Code Learning Outcome

This experiment links the technical concept to a practical no-code application development workflow. It highlights visual configuration, user experience, data handling and safe validation rather than treating the exercise as conventional full-code software development.

Precautions

- Use only fictional sample records for classroom demonstrations; avoid exposing passwords, tokens, employee information or real contact details.
- Record your own screenshots, observed outputs and deviations after executing the experiment. The examples below are models, not verified live results.
- Check access rights before sharing or publishing an app, report, workflow or externally reachable service.
