EXPERIMENT 9

Exploration of AI-Enabled Capabilities Embedded in Modern No-Code Applications

Subject: No-Code Application Development

Aim

To investigate AI features available in no-code applications and assess their usefulness, limitations and governance requirements.

Objectives

- Identify AI functions frequently embedded in visual application platforms.
- Design a sample AI-assisted workflow.
- Evaluate accuracy, privacy, human oversight and deployment constraints.

Selected Business Scenario

A customer support request intake application that classifies incoming tickets, suggests urgency and drafts a response while a human agent makes the final decision.

Requirements / Tools

- No-code platform with supported AI or external AI integration (subject to plan and availability)
- Synthetic example support tickets
- Human verification checklist and clearly defined data permissions

No-Code Connection

AI functions can classify incoming requests, extract text, suggest responses and summarize dashboard trends. A human reviewer and explicit quality checks are needed for business-critical outputs.

Illustrative Business Scenario

Prototype an AI-assisted request triage screen that suggests categories but does not automatically accept or reject an employee request.

Experimental Procedure

Follow these steps in the designated simulator, browser or visual app builder. Menu locations and available features may vary by product version and account plan.

1. Create fields for customer issue, category, urgency, suggested response and review status.

2. Investigate AI capabilities such as classification, summarization, text generation and document extraction.

3. Use fictional sample tickets to test suggested categories and response drafts.

4. Review each generated recommendation for factual accuracy and tone.

5. Route low-confidence or sensitive requests to manual review.

6. Record false classifications, latency and any feature limitations before proposing production use.

No-Code Application Perspective

- Identify the user action and the visual interface element involved (form, page, workflow or report).
- Trace the data movement from input to processing to stored record, report or notification.
- Identify configuration that replaces traditional hand-written code and note where scripting might still be required.
- Check whether the experiment can be repeated using sample records and documented settings.

Evidence to Collect

- Screenshot of the configured screen, topology, tool or application.
- A short observation table showing input, action and output.
- One successful test and one failed or exceptional test with expected behavior.

AI capabilities in a no-code app

Capability	Sample use	Main caution
Text classification	Route billing or technical tickets	Incorrect category
Summarization	Condense long requests	Loss of relevant context
Generative text	Draft initial replies	Fabricated or unsuitable advice
Document extraction	Read invoice fields	OCR / parsing errors
Prediction	Estimate ticket priority	Bias and weak training data

Simple evaluation checklist

Check	Pass criterion
Accuracy	Label agrees with reviewed sample
Privacy	No unnecessary personal data sent
Human control	Agent approves outgoing replies
Traceability	Classification and reviewer action logged

Interpretation / Analysis

- AI features differ substantially by platform, region, integration and subscription plan.
- Classification accuracy must be assessed using representative test cases, not a handful of successful demonstrations.
- AI suggestions should not automatically authorize refunds, access changes or sensitive decisions.

Evaluation Against a No-Code Solution

- Ease of creation: determine how much is configured visually rather than programmed.
- Data and integration: identify where records, connections or services are created and managed.
- Governance: consider role permissions, traceability and safe data handling.
- Limitations: identify any feature that may require paid access, external services or custom logic.

Verification / Test Cases

Suggested Test Record

Test	Input / action	Expected observation
Normal test	Valid sample values and supported action	Expected successful output
Boundary test	Missing value, invalid input or empty data	Validation or clear empty state
Access test	Unapproved user attempts restricted action	Access limited according to role
Repeatability	Re-run same valid example	Consistent output or explain differences

Observation Notes

During the practical session, replace the illustrative outcomes with actual observed results. Include the software/platform name, version if known, screenshots, and any errors encountered.

Results

An AI-assisted intake workflow was outlined with use cases and safeguards. Actual accuracy and available platform features require hands-on verification.

Conclusion

Embedded AI can accelerate routine work when combined with validation, privacy protections and a clear human approval path.

No-Code Learning Outcome

This experiment links the technical concept to a practical no-code application development workflow. It highlights visual configuration, user experience, data handling and safe validation rather than treating the exercise as conventional full-code software development.

Precautions

- Use only fictional sample records for classroom demonstrations; avoid exposing passwords, tokens, employee information or real contact details.
- Record your own screenshots, observed outputs and deviations after executing the experiment. The examples below are models, not verified live results.
- Check access rights before sharing or publishing an app, report, workflow or externally reachable service.
